

## ORTHOGRAPHY

This polar exploration concept is mainly designed for scientific researchers and adventure enthusiasts.

It refers to the design philosophy of the space station to establish modular connection between vehicles, to form a multi-functional local small base for scientific research and life.

In addition, due to the special topography (glacial landform) of the North and South poles, the vehicle with caterpillar track could adapt to complex terrain and has strong motorized transport capacity.

Basically, it is hoped that this polar exploration vehicle could improve the field working conditions of researchers, reduce work risks and fatigue levels, and contribute to the development of polar research.
