Decorative Bricks Wall

The existing building was an old workshop of a concrete factory, built during 50s-60s in last century. It was a brick building with steel structure-roof and brick walls. There are no columns in the internal of the building but the structure is very stable, which is very friendly to renovate. The

existing building was like a box which was boring, so appropriate extension is needed. The entrance and backstage part was extended with the occupied line. The extension parts were built with the same material of the existing building, but the construct method was new.

Those bricks and recycled tiles were reused creatively, the traditional and cheap materials could rebirth and repurpose in a new way.
